

# OCI DB Access

- Database Details
- Connect from Windows machine using Putty
- Connect to OCI/ATP DB using SQL Developer
- Connect to OCI ExaCS/RACCS DB using SQL Developer
  - Connection Issues
  - Alternatives to SSH Host for SQL Developer
- Connect to OCI DBs from OBIEEE client over SBS
- Connect to OCI DBs from Java Code
- FIA JDBC url :
- Requesting Roles for Named User Access
- OS TCP Parameter configuration for connections coming outside the OAL Teancy

## Database Details

### Non-Prod Bastion Servers

bastion1.bastion1.oal.oraclevcn.com	130.35.155.106
bastion2.bastion2.oal.oraclevcn.com	130.35.104.7

### Prod Bastion Servers

bastion1.bastion1.oal.oraclevcn.com	130.35.74.223
bastion2.bastion2.oal.oraclevcn.com	130.35.216.128

**PLEASE MAKE SURE YOU USE THE CORRECT ENV CONNECTION DETAILS AS IN TABLE ABOVE WHEN FOLLOWING THE INSTRUCTIONS BELOW.**

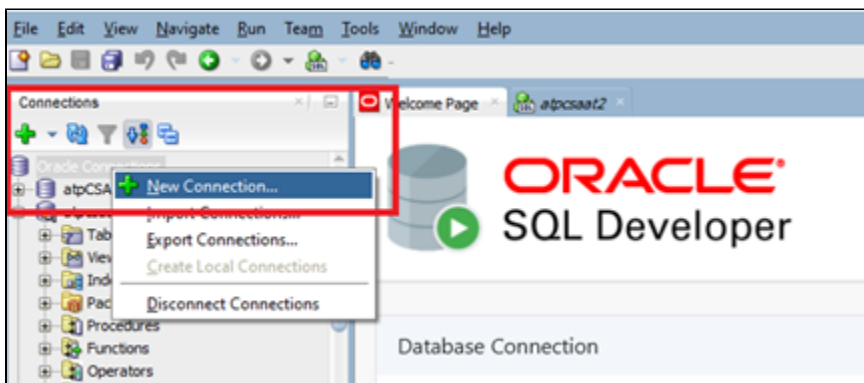

## Connect from Windows machine using Putty

Login to bastion servers ( [130.35.155.106](#) ~~130.35.209.3~~ / [130.35.104.7](#)) using oaluser OS user and set the envs with paasDB.env. as of now it supports only existing OCI DBs (PGXPET, PCDPAT , PCDPATMW, PCIPBT , atpcsaa2\_high, pclampat) :

```
[oaluser@bastion2 opc]$  
[oaluser@bastion2 opc]$ cd ~  
[oaluser@bastion2 ~]$ pwd  
/home/oaluser  
[oaluser@bastion2 ~]$ source paasDB.env  
[oaluser@bastion2 ~]$ sqlplus oalgeneric@pcdpat  
  
SQL*Plus: Release 18.0.0.0.0 - Production on Mon Apr 29 11:30:38 2019

Version 18.3.0.0.0  
  
SQL>
```

## Connect to OCI/ATP DB using SQL Developer

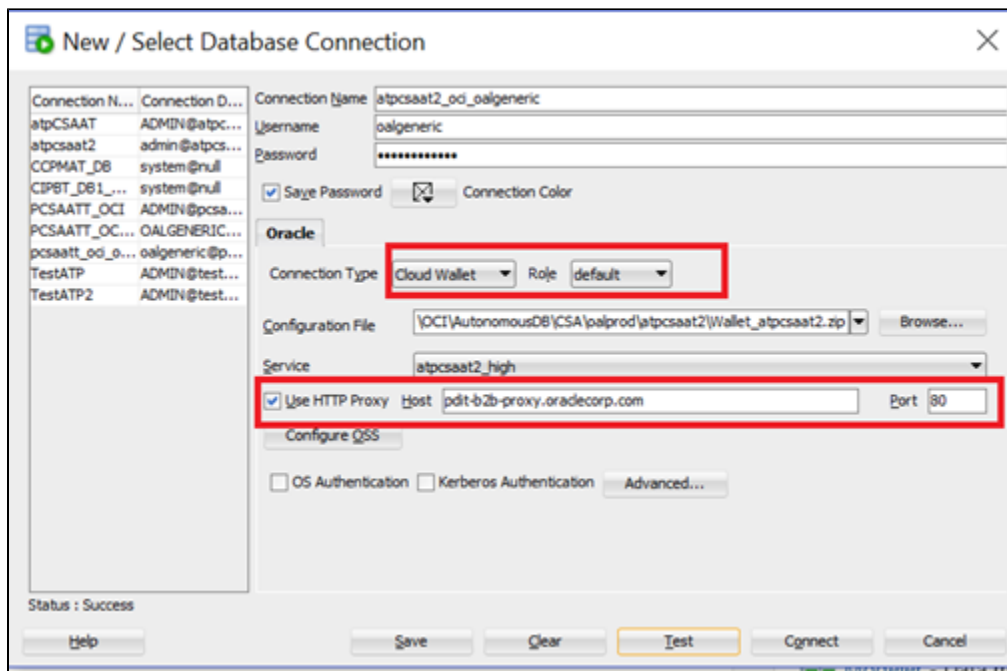

Install SQL Developer version 18.3 or higher  
Create New Connection as shown below

Fill in the following connection details as shown below

Remember to choose Connection Type: Cloud Wallet and Provide proxy details(Use proxy [ucf-b2b-proxy.us.oracle.com](http://ucf-b2b-proxy.us.oracle.com) if [pdit-b2b-proxy.us.oracle.com](http://pdit-b2b-proxy.us.oracle.com) does not work)

Test and Save connection

## Connect to OCI ExaCS/RACCS DB using SQL Developer

See [OCI SaaS Bastion service](#) for an explanation of the architecture behind this process. It creates an SSH tunnel via the SaaS Bastion Service host, authenticating to that host as your user account and Yubikey.

Be sure to [Connect to OCNA VPN](#) and have the required entitlement to [Connect to OAL SBS](#). If you aren't sure, test logging into the bastion host using PuTTY (Windows) or ssh (mac).

Open the SQL Developer SSH Host panel: View -> SSH

Right-click "SSH Hosts" and choose "New SSH Host...".

Fill in all the details as shown below with port forward details. You can add more port forwarding entries for this ssh host later if you want.

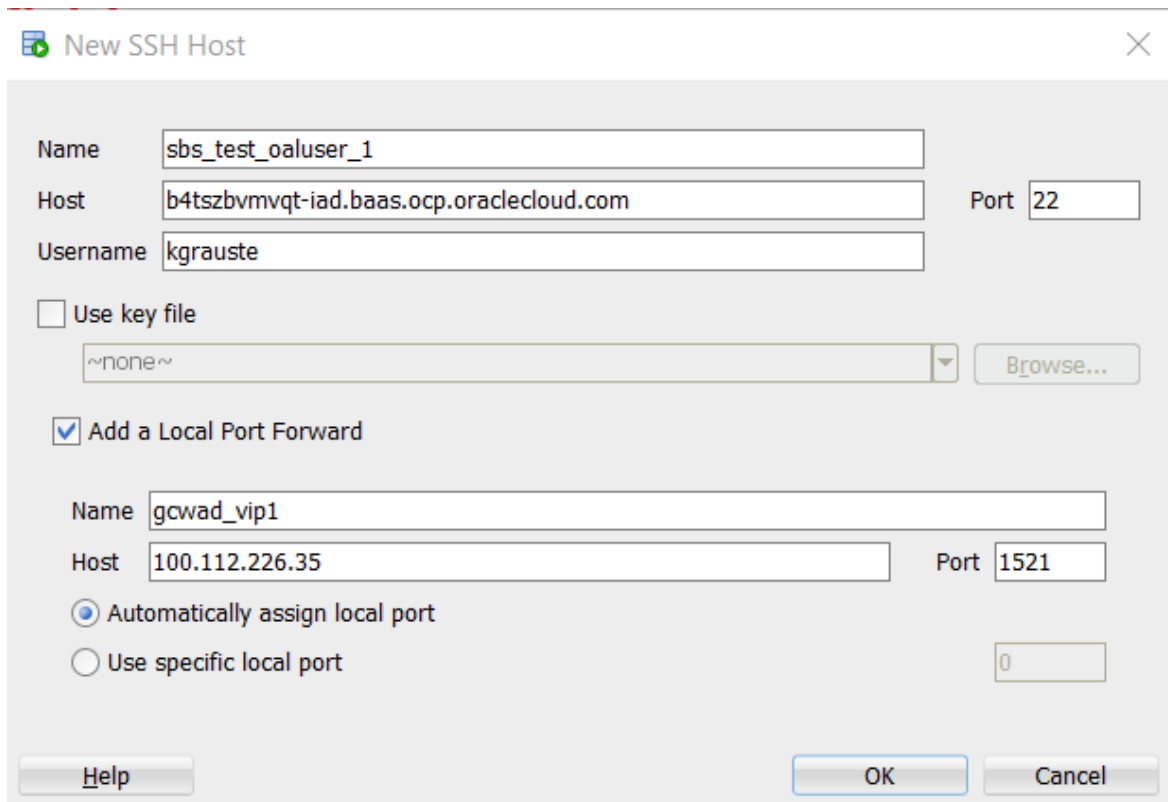

**Get SaaS Bastion hostname from [OCI SaaS Bastion service - Connect to OAL SBS](#)**

**Get Database VIP addresses, port and service name from [OCI DB Access](#) for the respective environment**

Use the VIP numeric address in the "Host" field, not the VIP name, as sqldeveloper on your pc might not be able to resolve the name to address using DNS.

Do not use a db host name, as the standard Exadata configuration is for the local listeners to listen on the VIP address.

**Username = Your user GUID**

The 'New SSH Host' dialog box is shown with the following fields and options:

- Name:** sbs\_test\_oaluser\_1
- Host:** b4tszbvmvqt-iad.baas.ocp.oraclecloud.com
- Port:** 22
- Username:** kgrauste
- ☐ Use key file
- (Key file dropdown)
- (Key file button)
- ☒ Add a Local Port Forward
- Name:** gcwad\_vip1
- Host:** 100.112.226.35
- Port:** 1521
- ☒ Automatically assign local port
- ☐ Use specific local port
- (Specific local port field)
- (Bottom left)
- (Bottom right)
- (Bottom right)

Create a new database connection as detailed below..  
Connections -> New Database Connection...

Fill in the connection details, using the SSH port forward you created above...

New / Select Database Connection X

Connection Na...	Connection De...	Name	Database Type	User Info	Details
kgrauste-atps	admin@kgrau...	gcwad	Oracle	Proxy User	Advanced
peo kgrauste-...	admin@kgrau...				
spm_oc5	admin@clscct...				

**Name**

**Database Type** Oracle

**User Info** Proxy User

**Authentication Type** Default

**Username**  **Role** default

**Password**  ☐ Save Password

**Connection Type** SSH

**Details** Advanced

**Port Forward** gcwad\_vip1 (sbs\_test\_oaluser\_1)

☐ SID

☒ Service name

Status :

Help
Save
Clear
Test
Connect
Cancel

Test the connection by clicking the "Test" button. It will prompt you to authenticate to the SSH host. Type your OCN passpharse then press your Yubikey...

Authentication Type Default

Testing

**SSH Authorization**

Enter password for user 'kgrauste'

OK
Cancel

A successful test will indicate as below...

**Status : Success**

☐ SID

☒ Service name

Help
Save
Clear
Test

Save and use your connection.

## Connection Issues

The SSH Host connection tends to timeout after a relatively short period of inactivity. This can show up as "Connection refused" errors like the following:

A quick solution is to disconnect via right-click on the SSH Host name:

Re-execute the query in your session, which will prompt for you to authenticate to the SSH Host again. There will also be a warning message that your connection was reset, which you can just click OK to accept:

## Alternatives to SSH Host for SQL Developer

You can create SSH tunnels with local port forwarding using other tools like PuTTY or command-line ssh. There are examples of each in other sections of this page. The same process works for SQL Developer, where you forward a port (example: 1521) to one of the local listeners for the database in OCI via an ssh session to an SBS bastion host. Once you establish that connection and tunnel, your database connection in SQL Developer will be connection type "Basic", hostname "localhost" and port should be the local port you are forwarding to the VIP listener. While SSH Host in SQL Developer is more convenient, you can have more control over timeout and other settings by using one of these alternate methods.

## Connect to OCI DBs from OBIEEE client over SBS

Step 1 - Connect to OCNA network and open windows substation in case of windows laptop. terminal can be used in case of Mac. For more information, please refer [OCI SaaS Bastion service](#)

Step 2 - start a tunnel across DB server and keep the session alive :

```
ssh shalpriy@bygezbymqzt-iad.baas.ocp.oraclecloud.com -L 1530:100.112.226.35:1521
```

```

shalpriy@SHALPRIY-IN:~$ ssh shalpriy@bygezbymqzt-iad.baas.ocp.oraclecloud.com -L 1530:100.112.226.35:1521

Use of the Oracle network and applications is intended
solely for Oracle's authorized users. The use of these
resources by Oracle employees and contractors is subject
to company policies, including the Code of Conduct, Acceptable
Use Policy and Information Protection Policy; access may be
monitored, logged, and audited, to the extent permitted by law,
in accordance with Oracle policies, and use of the Oracle
network and applications indicates consent to such monitoring
and recording. Unauthorized use of the Oracle network and
applications is prohibited and may result in termination of your
access, disciplinary action and/or civil and criminal penalties.
shalpriy@bygezbymqzt-iad.baas.ocp.oraclecloud.com's password:
Last login: Tue May 11 07:12:00 2021 from inet-160-34-113-49.oracle-ocna.com
[shalpriy@sbs-oaluser-test-01 ~]$

```

user localhost as host and port 1530 in connectionpool

## Connect to OCI DBs from Java Code

we have to use Data Source JNDI to connect to PaaS DB from java code. Below are high level steps:

Step 1 - Connect to bastion via Putty/Power shell with SSH tunneling across DB server. Follow steps given here to configure putty. Keep the putty connected.

```
ssh -i C:\Users\shalpriy.ORADEV\Documents\oalkey_ssh.key -L1530:10.3.192.39:1521 oaluser@130.35.155.106
```

```

PS C:\Users\shalpriy.ORADEV> ssh -i C:\Users\shalpriy.ORADEV\Documents\oalkey_ssh.key -L1530:10.3.192.39:1521 oaluser@130.35.155.106
Enter passphrase for key 'C:\Users\shalpriy.ORADEV\Documents\oalkey_ssh.key':
Last login: Wed May  8 07:14:19 2019 from 209.17.43.228
[oaluser@bastion1 ~]$

```

Step 2 - Start Integrated Web logic server in your local JDeveloper (Run - Start server instance)

Step 3 - Login to WLS Console and create data source:

- URL: <http://localhost:7101/console>
- user name password would be as configured by you when you created JDeveloper integrated server
- Expand Services -> click on Datasources
- Create New - Generic Data source
- Provide datasource name - (Please use same JNDI name and Data Source name as we have in PaaS WebLogic server. So that its not required to change code for patching.) like Oal-OalfndRuntime-ERP-DS & JNDI name like jdbc/OalfndRuntimeERP.
- Provide Database name as PaaS ERP/CRM DB service name
- Provide Host Name as: **localhost**
- Provide Port as **1530 (this is same port as used in putty SSH configuration)**
- Provide Database user name/password
- Once the Datasource is created, you can test it by drill down -> Monitoring -> Testing tab.

Keep the Integrated Server running.

**Java Sample Code to connect:**

```

package jnditest;

import java.sql.Connection;
import java.util.Hashtable;
import javax.naming.Context;
import javax.naming.InitialContext;
import javax.sql.DataSource;
import java.sql.*;

public class JNDITester {
    public JNDITester() {
        super();
    }

    public static void main(String[] args) {
        JNDITester jndiTester = new JNDITester();
        System.out.println("Testing");
        try {
            Connection connection = null;
            DataSource dataSource = null;
            Hashtable env = new Hashtable();
            env.put(Context.INITIAL_CONTEXT_FACTORY, "weblogic.jndi.WLInitialContextFactory");
            env.put(Context.PROVIDER_URL, "t3://localhost:7101"); //Optional
            InitialContext context = new InitialContext(env);
            System.out.println("context.INITIAL_CONTEXT_FACTORY ... " + context.INITIAL_CONTEXT_FACTORY);
            System.out.println(context);
            dataSource = (DataSource) context.lookup("jdbc/OalfndRuntimeERP");
            System.out.println("2 " + dataSource);
            connection = dataSource.getConnection();
            System.out.println("3 " + connection);
            PreparedStatement ps1 = connection.prepareStatement("select * from global_name");
            ResultSet rs1 = ps1.executeQuery();
            while (rs1.next()) {
                String d = rs1.getString(1);
                System.out.println("Instance Name is: " + d);
            }
        } catch (Exception e) {
            System.out.println("exception" + e);
            e.printStackTrace();
        }
    }
}

```

## Requesting Roles for Named User Access

CDP Database user and role provisioning integration with OIM

## OS TCP Parameter configuration for connections coming outside the OAL Tenancy

If you are connecting outside the OCI OAL tenancy you may see JDBC connection timeouts, which can be resolved by changing the tcp keep alive timing at the OS level of client servers.

The timeout on the corporate firewalls is 1800s (30 mins), i.e. if there is no network traffic for 30 mins or more, the firewall will drop the connection.

To keep the connection alive while SQL is running for more than 30mins without sending data back the client must send a keep-alive packet more often than the firewall timeout. This can be done by setting tcp\_keepalive\* parameters on the Servers that have clients that connect to the database.

Please get someone with root privs to do the following on your servers:

Check the current setting ....

```
# tail /proc/sys/net/ipv4/tcp_keepalive*
```

Expect to see tcp\_keepalive\_time with a value > **1800**, most OCI servers seem have it set to 7200 = 2hrs. ( All the on-prem servers in ADC/UCF have it set to 1000 )  
e.g.

```
==> /proc/sys/net/ipv4/tcp_keepalive_time <==  
7200
```

If the value is > 1800 then set it a lower value, e.g. 1000 the same as on the on-prem servers. ( this can be done hot without bouncing anything )

```
Edit the config file :  
  
# vi /etc/sysctl.conf  
  
Add/Modify the following setting to set it to 1000 seconds :  
  
net.ipv4.tcp_keepalive_time = 1000  
  
Apply the change :  
  
# sysctl -p
```

To be sure the JDBC connect string uses the new setting, make sure your connect string has an (ENABLE=BROKEN) clause in it e.g. (note that your SERVICE\_NAME value may vary from the example below based on your use case)

```
@(DESCRIPTION=( ENABLE=broken ) ( ADDRESS=( PROTOCOL=TCP ) ( HOST=lb-cman-prod-iad-oalprod.oraclecorp.com ) ( PORT=1524 ) )  
( CONNECT_DATA=( SERVER=DEDICATED ) ( SERVICE_NAME=gwap_rw.us.oracle.com ) ) )
```

( In my testing I didn't need it, but I found docs saying it was required.)
